With the AGORA (Assessment of Graduates' Outcomes and Retrospective Acknowledgements) project, an interdisciplinary group of scholars analyzed the employability and careers of Padua University graduates so that hints for improving the education processes at Padua University could stem.

The data collection started in September 2007 and lasted till the end of 2011. The whole project expired in February 2012.

The research is based on a telephone survey made three times in three years (at 6, 12 and 36 months after graduation), with varying cadence according to the faculty of origin, of a sample of 4769 graduates from the years 2007 and 2008.

For these reasons, the data are structured into three different datasets, one for each temporal survey.

The dataset for the first survey (6 months) refers only to graduates from the Faculty of Statistical Sciences, while the next two include a larger population.

In addition, the questionnaire submitted for the first survey differs from the one submitted for the subsequent surveys. For this reason, a specific record layout was set up for the first dataset, while, for both the second and third datasets, a single record layout valid was prepared.
